

idDATASAFE™ Data Protection Software

idDataSafe™ is a proven security solution for protecting your sensitive information.

Should your laptop get stolen, you are faced with the prospect of sensitive information falling into the wrong hands. idDataSafe™ is a new laptop utility software specifically created to counter unwanted third party access to your confidential information when your laptop is lost or stolen, working on the principle of secure and safe file deletion.

So how does it work? The moment your laptop is turned on, idDataSafe™ presents an innocuous-looking challenge: fail it, and all designated information on the system is safely and securely deleted. However, your important files have safely been stored with an automated incremental backup in a remote on-line location, ensuring you do not lose vital data.

idDataSafe™ also deletes itself, leaving no trace that there was anything of importance on the machine. This misdirection is a key part of idDataSafe™ the thief may be left with a working machine, but no indication that there was anything of value on it. Therefore no incentive is provided for more information gathering (possibly leading to further laptop thefts or other criminal activity).

idDataSafe™ protects your information even when all else has failed. It directly secures your business, whilst providing evidence of good corporate governance and helping you meet legal requirements such as Data Protection and Sarbanes-Oxley.

Key Features

- Securely deletes your vital information
- Safe on-line file backup included
- Protects you and your business from the legal and practical consequences of laptop information theft
- Improves the security of your organisation by providing protection in depth
- Enhances corporate reputation by its use
- Extremely easy to use and deploy
- Highly customisable yet can be policy driven
- Leaves no footprint behind so it cannot be detected
