

QCharger™ 8 and 16 Managed external battery charger

Every QCharger™ is configured to suit a specific laptop or netbook battery type, with a capacity of either 8 or 16 batteries* (dependent on model). Predominantly designed to charge Li-Ion or "Smart" batteries with internal control circuits, the QCharger™ can also charge standard battery types.

The QCharger™ incorporates an LCD display which indicates the type of battery being charged, its state of health and any warnings should a battery in a particular bay require recalibration. Visualisation of the charging process is also enhanced by colour coded LED indicators which display the status for each individual battery bay.

The QCharger™ automatically reads from a "Smart" battery if it requires recalibration. This is indicated to the user via the LEDs and LCD display. The battery can then be moved to bay 1 where it can be discharged and recharged to perform a recalibration. This process is called "conditioning".

An excellent feature of the QCharger™ is that it is factory upgradable. This means that if a user no longer uses the battery type that the unit was initially configured for, it can be easily upgraded to support the new battery type. This makes the QCharger™ extremely cost effective and adds to its longevity.

*Depends on battery type and size.
